Résumé

Basic

WO8607004 A Tubing inhibited polyethylene film is formed by extruding polyethylene plasticised with mineral oil in a wt. ratio of 75-85:25-15; swelling the resulting film tubing with air; and supplying an oil-soluble volatile corrosion inhibitor to the inside of the tubing.

Specifically the corrosion inhibitor is supplied in vapour form with the air used for swelling the tubing; or is supplied in liq. form as a spray in an electric field of 2-10 kV/cm with a spray rate of 15-40 g/min.

USE/ADVANTAGE - As packaging film and as protective film for metallic surfaces etc. Method is efficient in its use of corrosion inhibitor and a high quality prod. is obtd. (18pp Dwg.No.0/0)

Equiv. Angl.

GB2188274 B A process for producing a tubular inhibited polyethylene film by extruding a polyethylene melt, subsequently blowing-up the resulting polyethylene tube with air and introducing a volatile corrosion inhibitor into the tube cavity, characterised in that in the course of extrusion use is made of polyethylene plasticised with a mineral oil within the range 75-85:25-15 and that, as the volatile corrosion inhibitor use is made of an oil-soluble corrosion inhibitor.

Résumé

Basic

DE29807443 U Packaging material for shipping purposes, especially for protection against water penetration, has a base sheet and paraffin or wax coating(s) containing corrosion inhibitor for ferrous and/or non-ferrous metals.

ADVANTAGE - Various aluminium composite films are normally used for protection against corrosion and for export packaging, whilst composite films are used as barriers against diffusion of moisture in the air. Desiccants or (volatile) corrosion inhibitors may be included in the package. Some volatile corrosion inhibitors used for impregnating paper and other bases are water-soluble, with the result that the package can become soaked by condensed moisture, which leads to corrosion. This is partly avoided by backing the paper with plastics film, e.g. polyethylene or polypropylene, or with paraffin wax. This material is cheap and water-tight. (Dwg.0/0)

Résumé

Basic

WO8607077 A Anticorrosion material consists of (in wt.%) mineral oil 20-45, an oil-sol. corrosion inhibitor (I) 2-50, and polyethylene the balance. (I) is: a contact corrosion inhibitor consisting of a sulphonated or nitrated mineral oil or the neutralisation prod. of these with an alkali or Ca(OH)₂; or the neutralisation prod. of sulphated mineral oil with urea; or synthetic or natural fatty acid distn. vat residues or the condensation prod. of these with organic amines; or the condensation prod. of alkenyl-succinic anhydride and urea. Or (I) is a volatile corrosion inhibitor comprising the salt of (di)cyclo-hexylamine and an organic acid or a hetero-alkylated lower amine. Or (I) is a mixt. of contact and volatile corrosion inhibitors.

USE/ADVANTAGE - In hermetising structures such as gaskets, sealing rings, etc. and in anticorrosion coatings for metallic packagings etc. Material has effective, long-lasting anticorrosion properties. (17pp Dwg.No.0/0)

Equiv. Angl.

GB2187466 B An anticorrosive material comprising polyethylene plasticised with a mineral oil and containing as an oil-soluble corrosion inhibitor, (a) contact corrosion inhibitor selected from: a sulphonated or nitrated mineral oil, or a product of neutralisation or a sulphonated or a nitrated mineral oil with an alkali, or a product of neutralisation of a sulphonated mineral oil with urea, or bottoms from distillation of synthetic or naturally occuring fatty acids, or products of condensation of said bottoms with organic amines, or a product of condensation of an alkenylsuccinic anhydride and urea, or (b) a volatile corrosion inhibitor selected from: a salt of dicyclohexylamine and an organic acid, or tertiary amine having a nitrile group, or (c) a mixture of both contact (a) and volatile (b) corrosion inhibitors, the proportions of the anticorrosive material components being as follows: per cent by weight: mineral oil, 20-45, oil-soluble corrosion inhibitor 2-50, polyethylene the balance. Résumé

Basic

DE3417149 A Synthetic plastic anti-corrosion film contains an anti-corrosion agent applied as a coating on a previously corona treated film. Pref. the plastic film is only partly coated in strips, permitting subsequent sealing of the film. The film is pref. a polyethylene, foamed film or PVC film esp. an air cushion film where the anti-corrosion agent is applied on the total surface of the ssimpler side.

The air-cushion film may be produced using deep draw rolls in the usual way and welded to another non-coated identical plastic film.

Specifically claimed is use of dicyclohexylammonium nitrite, cyclohexyl ammonium N- cyclohexyl-carbonate, quinidine nitrate, urea and/or^ sodium benzoate and other components of a heat-sealable lacquer, ethanol as solvent andopt. other processing aids and additives.

USE - The films are useful for prodn. of sealed packaging bags and wrapping, box inserts, sacks and box covers.
